# **APPENDIX F:** Using Brouwer-mean elements from TBUS Part IV

The Brouwer-mean elements in part IV of the APT predict bulletin (TBUS) can be used in a stand-alone Brouwer-Lyddane orbit prediction package to determine orbit position information at any time  $(t - t_0)$  where  $t_0$  represents the time of the Brouwer mean elements in part IV and t represents the user request time. The Brouwer-Lyddane algorithm is an analytical solution of satellite motion for a simplified disturbing potential field limited to zonal harmonic coefficients for  $J_2$  through  $J_5$ . Lyddane modified Brouwer's formulation to obtain algorithms applicable for zero eccentricity and zero inclination.

The Brouwer-Lyddane orbit prediction package contains seven subroutines and one block data subprogram which can be called from a user supplied driver to obtain orbit information in the form desired by the user.

The first subroutine to be called is BROLYD. This subroutine takes as input the Brouwer mean or osculating elements at time  $t_0$ , and outputs the osculating Keplerian and Brouwer mean elements at the time (t -  $t_0$ ) given in common block BLCNST. The calling sequence for subroutine BROLYD is described below.

If users require output in the form of inertial position and velocity vectors then a second subroutine CELEM can be called. This subroutine takes as input the osculating Keplerian elements for BROLYD and outputs the inertial position and velocity vectors. The calling sequences for subroutine CELEM is also described below.

A third subroutine, BFIXED, transforms the position and velocity vectors from CELEM to earth fixed coordinates. The user must supply the Greenwich hour angle to this subroutine.

Subroutine XYZPLH converts the position vector in the earth fixed coordinates to geodetic latitude, east longitude, and height.

Three other subroutines are included in this prediction package. These are DKEPLR, MA3331, and DATAN0. DKEPLR is a subroutine to solve Kepler's equation. MA3331 computes the product of a 3 x 3 matrix and a 3 x 1 matrix. DATAN0 computes a value for the arc-tangent between 0 and  $2\pi$ .

A block data subprogram for the common block BLCNST includes several constants needed by the stand-alone orbit prediction package. These constants are described below and are presently used in NESDIS's polar navigation system.

## CALLING SEQUENCE FOR SUBROUTINE BROLYD:

CALL BROLYD (OSCELE, DPELE, IPERT, IPASS, IDMEAN, ORBEL)

#### **ARGUMENTS:**

OSCELE - OUTPUT OSCULATING ELEMENTS AT TIME TTO

OSCELE (1) = SEMI-MAJOR AXIS

OSCELE (2) = ECCENTRICITY

OSCELE (3) = INCLINATION

OSCELE(4) = NODE

OSCELE (5) = ARGUMENT OF PERIGEE

OSCELE(6) = MEAN ANOMALY

DPELE - INPUT IS OSCULATING ELEMENTS AT EPOCH IF IDMEAN = 0

INPUT IS BROUWER MEAN AT EPOCH IF IDMEAN  $\square$  0 OUTPUT ELEMENTS ARE BROUWER MEAN AT TIME TTO

DPELE (1) = SEMI-MAJOR AXIS

DPELE (2) = ECCENTRICITY

DPELE (3) = INCLINATION

DPELE(4) = NODE

DPELE (5) = ARGUMENT OF PERIGEE

DPELE (6) = MEAN ANOMALY

## IDMEAN - DETERMINES WHICH ELEMENTS ARE INPUT IN DPELE

= 0, OSCULATING

□ 0, BROUWER MEAN

IPASS =1, COMPUTE CONSTANTS NEEDED IN COMPUTATION OF OSCULATING =2, UPDATE OSCULATING ELEMENT TO OBSERVATION TIME WITHOUT

ELEMENTS UPDATING

CONSTANTS

IPERT =0, NO PERTURBATIONS DUE TO OBLATENESS COMPUTED

- =1, SECULAR TERMS COMPUTED
- =2, SECULAR + LONG PERIODIC + SHORT PERIODIC TERMS

ORBEL - OUTPUT AUXILIARY ORBITAL ELEMENTS

#### CALLING SEQUENCE FOR SUBROUTINE CELEM:

CALL CELEM (ORBEL, GMC, PV, VV)

## **ARGUMENTS**:

**ORBEL - INPUT OSCULATING ELEMENTS** 

ORBEL(1) = SEMI-MAJOR AXIS

ORBEL (2) = ECCENTRICITY

ORBEL (3) = INCLINATION

ORBEL(4) = NODE

ORBEL (5) = ARGUMENT OF PERIGEE

ORBEL(6) = MEAN ANOMALY

## GMC - INPUT GRAVITATIONAL CONSTANT

#### PV - OUTPUT CARTESIAN POSITION VECTOR

PV(1) = X

PV(2) = Y

PV(3) = Z

## VV - OUTPUT CARTESIAN VELOCITY VECTOR

VV(1) = XDOT

VV(2) = YDOT

VV(3) = ZDOT

#### **COMMON BLOCK BLCNST**

COMMON/BLCNST/TTO, R, AE, GM, BJ2, BJ3, BJ4, BJ5, FLTINV, XKE, ESQ

## VARIABLES USED IN COMMON/BLCNST/:

TTO - INPUT REQUEST TIME IN SECONDS FROM EPOCH

R - OUTPUT MAGNITUDE OF SATELLITE RADIUS VECTOR

AE - INPUT MEAN EQUATORIAL RADIUS OF THE EARTH (KM)

GM - INPUT GRAVITATIONAL CONSTANT OF THE EARTH (KM<sup>3</sup>/SEC<sup>2</sup>)

BJ2 - INPUT C<sub>2,0</sub> ZONAL HARMONIC COEFFICIENT

BJ3 - INPUT  $C_{3,\,0}$  ZONAL HARMONIC COEFFICIENT

BJ4 - INPUT  $C_{4,\,0}$  ZONAL HARMONIC COEFFICIENT

BJ5 - INPUT C<sub>5.0</sub> ZONAL HARMONIC COEFFICIENT

FLTINV - INPUT INVERSE FLATTENING COEFFICIENT (1/F)

XKE - GRAVITATIONAL CONSTANT (EARTH RADII)<sup>3/2</sup>/MIN)

ESQ - THE SQUARE OF THE MAJOR ECCENTRICITY CALCULATED FROM e<sup>2</sup>=(2f - f<sup>2</sup>)
